13

Production of microphone powder. N. P. Chiryskii and D. M. Chetvertinov. Bull. Acad. Sci. U.R.S.S., Class. ¹⁹⁴⁷, No. 10, p. 225-226 (in Russian).—Satisfactory microphone powders are produced from domestic anthracite by heating the coarsely crushed coal at 1000-1200° or 1400-1600°, depending on the variety; absence of coal dust in the material is essential; there is no need for a 11 atm. if the inlet is protected with charcoal. The permissible ash content is 1-2%. The thermal treatment is followed by 2nd comminution. Crushing should be

done in an app., producing sharp-edged lumps, rather than rounded or lamellar forms, and no dust. N. Thom

Quality of Coke and the Operation of a Blast Furnace,"
N. P. Chizhevskiy and D. M. Chernyshev, Gant Tech
Sci, Inst of Mineral Fuels, Acad Sci USSR, 4 pp

"Stal" No 6

New method permits classification of coke according
to CGS system. This is related to introduction of
coke into blast furnaces and is therefore very closely
tied up with operation of these furnaces.

Relation between the indexes of quality of coke and blast-furnace operation. N. P. Chizhevskii and D. M. Chernyshov, Sib. 8, 405-8(1948).—A new app. for testing the strength of coke is described. A bed of coke is placed on a shelf and a weight is dropped on it from a height of 2 m. A definite relationship existed between the work spent on reducing the size of coke and the total surface area of the coke. The total surface area of the coke (at the tuyères) was then correlated with blast-furnace efficiency. When furnace efficiency was plotted in arbitrary units vs. diminishing surface area, i.e. greater strength of coke, a straight line was obtained. M. Bösch

CA

Combustibility of blast-furnace coke. D. M. Cherny-
shev. *Stal* 8, 589-91(1948).—A new formula is derived
which combines several characteristics of metallurgical
coke and which serves as an indicator of the quality of
coke. In its final form this formula is $K = (V_s + 1)/SR$,
where K is referred to as the coke index, V_s is the vol. of
voids in a given quantity of coke, S is the surface area of
the coke, and R_s is the combustibility of the coke. R_s
is detd. from the rate of reaction between coke and O in
the air. The relation between K and blast-furnace out-
put was tested in production. When all the factors except
coke were approx. the same, the relation between K and the
output was a straight line. M. Hesch

AUTHOR: Chernyshev, D. P.

TITLE: Shaft-furnace Smelting of Oxidized Nickel Ores at the Yuzhuralnikel' Kombinat, Methods of Intensifying the Process and of Reducing Loss in the Slag (Shakhtnaya plavka okislennykh nikellevykh rud na kombinate Yuzhuralnikel', puti yeye intensifikatsii i obedneniya otval'nykh shlakov)

PERIODICAL: Materialy Soveshchaniya po vopr. intensifik. i usoversh. dobychi i tekhnol. pererabotki medno-nikellevykh i nikellevykh rud. 1956 g. Moscow, Profizdat, 1957, pp 157-163

ABSTRACT: The smelting of oxidized Ni ore in shaft furnaces at the Orsk Plant is characterized by high carry-off of dust (up to 20%), peripheral furnace operation, and high top-gas temperature (up to 800°C). Improvement in the smelting process is possible by: 1) Improvement of charge preparation (proportioning of the ore, smelting of fluxed and sulfided sinter, elimination of raw ore from the furnace charge); 2) changing the smelting regime (raising O₂ blow to 25-40%, heating the blow, raising the vapor pressure of the blow

Card 1/2

Shaft-furnace Smelting of Oxidized Nickel Ores (cont.)

SOV/137-58-11-22224

to 2000 mm water, with increase in ore-dust depth to 6 m). Test heats under these conditions resulted in a 20% rise in output, a 15% saving in coke consumption, a reduction in loss of blow, and a diminution of CO in the gases to 8% as against 18% CO₂, plus a decline in top-gas temperature to 200-400°. The present furnace profile, which presents an 1800 mm width at the throat and a 1000 mm width at the hearth makes for formation of chilled residue. Reduction in throat width to 1450 mm reduces sow formation and causes the charge to descend more uniformly. A furnace is being designed with sealed throat.

Alf., and millet, and those on the cover where alfalfa and sainfoin. The green stuff and hay yield of the covering annual grasses was high (sorghum 70 centners per hectare of hay, or 274 centners per hectare of green stuff). The alfalfa and sainfoin, sown together with the seeds of the covering grasses, developed wholly satisfactorily and wintered well. The average alfalfa yield varied in relation to the covering crops; the green stuff from 60.9 centners per hectare (after Hungarian grass) to 72.2 centners per hectare (after Foxtail millet). With pure sowing of alfalfa (without a covering crop) the green mass harvest was 55.1 centners per hectare and that of hay was 20.9 centners per ha. When sown in summer both the covering crop and the alfalfa yields were lowered.

TITLE: Following the assigned course [orthodromic method of flight]

SOURCE: Grazhdanskaya aviatsiya, no. 6, 1966, 24-25

TOPIC TAGS: orthodromic flight, loxodromic flight, civil aviation, gyroscope, magnetic guidance, Doppler shift indicator, radio guidance/DGMK-7 gyroscope p

ABSTRACT: Advantages of the orthodromic flight method as compared to the loxodromic flight method are discussed from the viewpoint of aircraft maintenance cost reduction. The author describes the experience of crews of TU-114 aircraft of the Moscow Administration of Transport Aviation involving the use of existing navigation aids for orthodromic flight on the Moscow-Khabarovsk route. The combined use of a directional gyroscope, a magnetic course indicator, radio navigation, and the Doppler shift indicator is explained. This method can be used on aircraft with a separate system for indicating the magnetic course on a DGMK-7 gyromagnetic compass and the orthodromic direction on a GPK-52 directional gyroscope. The use of a gyromagnetic course indicator and radio bearing is also mentioned. Orig. art. has: 3 figures. [GC]

PERIODICAL: Byul. Tsentr. in-t inform. M-va tsvetn. metallurgii SSSR,
1957, Nr 5, p 3 (obl.)

ABSTRACT: Description of a concentration meter employed for determination of the concentration of free H₂SO₄ in pickling baths. The accuracy of determination amounts to ±5 g/liter within the limits of a 20-150 g/liter scale. The determination of the concentration of H₂SO₄ depends upon the principle of measurement of electrical conductivity of a solution by means of an unbalanced bridge operating on 127-v A-C. The device consists of a gage with a handle and an indicator. The gage unit consists of an enclosure which contains a standard gage and an operating gage. The indicator consists of an electromagnetic ammeter graduated in g/liter. The circuitry of the device is shown. Yu. B.

TITLE: The Raw Material Base of Ferrous Metallurgy in the Trans-Baykal Region (Syr'yevaya baza chernoy metallurgii v Zabaykal'ye)

PERIODICAL: Gornyy zhurnal, 1958, Nr 7, pp 23-27 (USSR)

ABSTRACT: The iron ore reserves of the Trans-Baykal region are estimated at 2 billion tons. Only a few of the deposits have been sufficiently explored and the Mezhdudomstvennaya postoyannaya komissiya po zhelezu (The Interdepartmental Permanent Iron Commission) does not propose to develop them in the next 15-20 years. The author enumerates various deposits of this region and describes their general characteristics. The most important, the Berezov deposits, consist of siderite and limonite ores. They have a very low percentage of harmful impurities, and by content of iron, they are equal to the ores of the Baykal region. The deposit is situated in the south-east part of the Chita oblast', 10 km from the Soviet-Chinese border. The author describes other smaller deposits in the region. There are 2 figures and 2 tables.

AUTHOR: Chernyshev, G.B.

TITLE: The Krasnokamenskaya Group of Mineral Deposits and Its Importance for the Third Metallurgical Base of the USSR

PERIODICAL: Razvedka i okhrana nedr, 1959, Nr 8, pp 1-8 (USSR)

ABSTRACT: The Krasnokamenskaya group and other iron ore deposits are situated in the inhabited regions between the south-western spurs of Eastern Sayan in the Krasnoyarskiy Kray (chart 1). The completion of the Abakan - Tayshet railway will create favorable conditions for the exploitation of the deposits situated along this railway. Exploring and prospecting operations in the Krasnokamenskaya group and other deposits have sharply increased, and at the beginning of 1959, general reserves in magnetite ores reached 156 million tons. The Krasnokamenskaya group alone accounted for 97 million tons. The further discovery of new magnetic anomalies (Tayat,

Card 1/5

SOV/132-59-8-1/18

The Krasnokamenskaya Group of Mineral Deposits and Its Importance
for the Third Metallurgical Base of the USSR

Tabrat, Bragino, etc) fixes the probable ore reserves of the region at more than 400 million tons, with large reserves of blast-furnace and Martin ores in that amount. According to the geological survey of the Krasnokamenskaya group of deposits, conducted by the Krasnoyarskoye geologicheskoye upravleniye (Krasnoyarsk Geological Directorate), iron ores of this group are of special commercial value, because of: their situation near the future railway, their high iron content and relatively-shallow occurrence. The Rudnyy Kaskad (tables 1 and 2), Odinochnoye and Margoz deposits are situated 9 to 14 km from the future Kashurnikovo railway station, 200 km from Abakan and 570 km from the Kuznetskiy metallurgical kombinat (Kuznetsk Metallurgical Combine). All deposits of the Krasnokamenskaya group are concentrated in the metamorphized strata of Paleozoic sedimentary and effusive rocks faulted by a large

Card 2/5

SOV/132-59-8-1/18

The Krasnokamenskaya Group of Mineral Deposits and Its Importance
for the Third Metallurgical Base of the USSR

Variscian intrusion in the Kanzybino Massif. The author gives a detailed description of all mentioned ore deposits. Their average iron content is 50%. The hydrogeological and technical conditions of the exploitation of these deposits have been little studied. The exploitation will be conducted by underground mining, and the hardness of its enclosing rocks, large dimensions of the deposits, and the gradual increase in ore beds permit the use of highly productive methods of mining with deep bore holes. The author further stresses the necessity of steadily increasing the production of extracted ore. During the Seven Year Plan, two new large metallurgical plants will be constructed: the West Siberian Plant near Stalinsk in the Kemerovskaya Oblast' and the Tayshet Plant. With the already operating Kuznetsk Combine (where a new blast furnace will be working at the end of 1959), these

Card 3/5

SOV/132-59-8-1/18

The Krasnokamenskaya Group of Mineral Deposits and Its Importance
for the Third Metallurgical Base of the USSR

three plants will form the foundation of the Third Metallurgical Base. Their foreseen production of pig iron is fixed at 7.5 million tons. Altogether five new blast furnaces will be put into action in the 1959-1965 period in Siberia. During this time the extraction of iron ore must be increased 4.5 times, and by 1965 must be 34.4 million tons. The Irkutsk and Altay sovnarkhozes must meet the production needs of the West Siberian Plant by guaranteeing the following quantities of extracted iron ore yearly: the Korshunovo Mining Concentrating Combine - 12 million tons, the Beloretskiy Mine - 3 million tons, and the Inskiy Mine - 2.4 million tons. It is expected that in the period 1959-1961, all ore reserves of the East Sayan region (table 3) will increase by more than 300 million tons, and that the general reserves of categories B and C₁ coal by 1 January 1962 will be 370 and

Card 4/5

SOV/132-59-8-1/18

The Krasnokamenskaya Group of Mineral Deposits and Its Importance
for the Third Metallurgical Base of the USSR

140 million tons, including about 150 and 70 million tons of Martin ores. As the Abakan-Artemovsk section of the railway will be put into use in middle 1960, the beginning of the exploitation of the Margoz deposit is foreseen for 1962, that of the Rudnyy Kaskad - for 1963, and the Odinochnaya deposit - for 1964. All basic indicators of future industrial exploitation of the Krasnokamenskaya and Irbino groups of deposits and those of the Beloretskiy and Inskiy Mines in the Altay are indicated in table 3; compiled by the author from his comparative technical and economic calculations according to data from the Institut Kuzbassgiproruda (the Kuzbassgiproruda Institute). There are 3 tables, and 1 chart.

PURPOSE: This collection of papers is intended to furnish information on industrial resources in Eastern Siberia and to provide a basis for future developmental planning in the field of ferrous metallurgy.

COVERAGE: The collection is a summary of the proceedings of the Ferrous Metallurgy Section of the Joint Conference of Representatives of the Academy of Sciences USSR, the State Planning Commission, and the Council of Ministers RSFSR on the Development of the Industrial Resources of Eastern Siberia. The collection deals with four main areas of development in Eastern Siberia: 1) Mineral resources, 2) the fuel base, 3) prospects for the development of ferrous metallurgy, and 4) problems in the development of electrometallurgy. A list of the 112 members of

TITLE: Automatic butt welding of nonrotating low-carbon steel pipes in carbon
dioxide

SOURCE: Svarochnoye proizvodstvo, no. 3, 1966, 32-34

TOPIC TAGS: butt welding, automatic welding, welding technology/ Sv-08G2S electrode
wire, St3 steel

ABSTRACT: To improve the quality of butt welding of nonrotating low-carbon steel pipes, a method which uses lateral oscillations of the welding electrode was developed at MVTU (A. I. Akulov and V. V. Spitsyn. Svarka trub v uglerodistom gaze s poperechnymi kilebaniyami elektroda. Svarochnoye proizvodstvo, 1960, No. 9). Low-carbon steel pipes (195 x 6, 219 x 8, and 273 x 8 mm diameter) with V-shaped butts were welded with Sv-08G2S electrode wire. The root welds (with 2-mm clearance) were performed with a vibration amplitude of 6--8 mm and 40--90 cpm and the finishing welds with an amplitude of 12--14 mm (to cover the V-opening). Curves of welding current as a function of electrode speed (0--40 m/hr) are presented and sections at different positions in the butt weld are shown. To determine the strength of the

ACC NR: AP6008817

welds, 8--12 mm thick St3 steel plates were welded and tested for tensile and impact strength. The quality of the welds could be substantially improved by proper choice of lateral electrode vibrations. Orig. art. has: 3 figures and 1 table.

AUTHOR: Chernyshev, G. N. (Moscow)

TITLE: Effect of concentrated force and concentrated moment on an anisotropic plate

SOURCE: Inzhenernyy zhurnal, v. 4, no. 1, 1964, 155-158

TOPIC TAGS: concentrated force, concentrated moment, anisotropic plate, flexure, coefficient of anisotropy, Dirac delta function, operator equation, elliptic differential equation

ABSTRACT: Let L be an elliptic operator and D_{ik} the coefficients of isotropy.

The equation of flexure has the form

$$L(w) = q(x, y). \quad (1)$$

where

$$L = D_{11} \frac{\partial^4}{\partial x^4} + 4D_{12} \frac{\partial^4}{\partial x^3 \partial y} + 2(D_{13} + 2D_{44}) \frac{\partial^4}{\partial x^2 \partial y^2} + 4D_{24} \frac{\partial^4}{\partial x \partial y^3} + D_{33} \frac{\partial^4}{\partial y^4}, \quad (2)$$

Card 1/2

ACCESSION NR: AP4026964

in the problem of an anisotropic plate. The flexure corresponds to the effect of a concentrated force, perpendicular to the surface of the plate, and of a concentrated moment, applied at an arbitrary interior point (x_0, y_0) . Mathematically, the unit intensity of the concentrated force corresponds to the Dirac delta-function. The coefficients of anisotropy are assumed constant with respect to the coordinate system of the plate. The method used is due to Ye. Ye. Levi (O lineynykh ellipticheskikh uravneniyakh v chastnykh proizvodnykh. Uspekhi matem. nauk, vyp. VIII, 1941) to find a solution of the operator equation $L(w) = \delta(x-x_0, y-y_0)$ satisfying the given boundary conditions. All the solutions $L(w) = \delta$, at the point (x_0, y_0) , have definite, identical singularities. To solve the problem completely, it is necessary to find a fundamental solution w_1 and an analytic solution w_2 so that $w = w_1 + w_2$ satisfies the boundary conditions. Only the solution of w_1 is constructed by the author. Orig. art. has: 14 formulas.

1. Vibrating of alloys during solidification. I. A. Chernyshev. *Lietuvos Tinklo* 1953, No. 10, 13-18. Math. on solidification phenomena is examd. For all alloys the max. acceleration of forced vibrations should not exceed normal gravitational acceleration, while the effect of the frequency is crit. Tensile strength and ductility of Fe increase, for example, with increasing acceleration reaching, resp., 175-180% and 150-250% of the original and then dropping. Calcd. results for the effect of acceleration plotted against experimentally obtained results showed good agreement.

TITLE: SHF-power switching by semiconductor diodes

SOURCE: Radiotekhnika i elektronika, v. 11, no. 10, 1966, 1899-1901

TOPIC TAGS: SHF, semiconductor diode, SHF switch

ABSTRACT: The SHF-diode switch changes its resistance upon application of a suitable bias voltage (D. W. Foldman et al., Rev. Sc. Instr., 1961, 32, 74). Placed in a waveguide, the diode changes the value of the reflected SHF power. Switches (see figure) for 3.2-cm and 2.5-cm wavelengths with D-13 Ge diodes were constructed, tested, and used (since 1962) in Soviet radio-spectroscopes. Measured SHF loss in the switch was 2 db or less; switching factor, 40--60 db. SHF-pulse rise and fall times were 1.5 usec or less when the switch was opened (or closed) by a square bias pulse with a rise time of 50 nsec. Orig. art. has: 2 figures.
